6	Widely Tunable Far Infrared Hot Hole Semiconductor Lasers	1
	<i>Erik Bründermann</i>	
6.1	Introduction	1
6.1.1	Tunable germanium lasers	3
6.1.2	Motivation	4
6.1.3	Applications	6
6.2	Hot hole laser model	6
6.2.1	Semi-classical model	7
6.2.2	Magneto-phonon and magneto-impurity effects	11
6.2.3	Scattering mechanisms	17
6.2.4	Optical gain	20
6.2.5	Hall effect and device geometry	24
6.2.6	Quantum mechanical model	29
6.2.7	Uniaxial stress	33
6.2.8	Impurities and self-absorption processes	34
6.2.9	Monte Carlo simulations	38
6.2.10	Thermal effects	39
6.3	Laser material fabrication	42
6.3.1	Growth of germanium laser material	42
6.3.2	Characterization	43
6.3.3	Doping by diffusion	44

ii CONTENTS

6.3.4	Ohmic contacts for germanium and silicon	45
6.3.5	Laser devices with opposing contacts	46
6.3.6	Laser devices with coplanar contacts	46
6.3.7	Laser devices with multiple contacts	47
6.4	Technology	47
6.4.1	Electric field generation	47
6.4.2	Magnetic field generation	48
6.4.3	Cooling systems	50
6.4.4	Mode-locking	51
6.5	Laser emission	53
6.5.1	Germanium laser resonators	54
6.5.2	Spectra and mode structure	58
6.5.3	Output power	59
6.6	Future trends	60
6.6.1	Continuous wave germanium lasers	61
6.6.2	Picosecond pulsed germanium lasers	62
6.6.3	Hot hole silicon, diamond and III-V lasers	63
6.6.4	Lasers without magnetic field under uniaxial stress	64
6.6.5	Lasers in parallel electric and magnetic fields	65
6.7	Summary	65
	References	67
